## NeoColab\_REC\_CS23221\_Python Programming

### REC\_Python\_Week 6\_CY

Attempt : 1  
Total Mark : 40  
Marks Obtained : 36.5

### Section 1 : Coding

#### 1. Problem Statement

Write a program to read the Register Number and Mobile Number of a student. Create user-defined exception and handle the following:

If the Register Number does not contain exactly 9 characters in the specified format(2 numbers followed by 3 characters followed by 4 numbers) or if the Mobile Number does not contain exactly 10 characters, throw an `IllegalArgumentException`. If the Mobile Number contains any character other than a digit, raise a `NumberFormatException`. If the Register Number contains any character other than digits and alphabets, throw a `NoSuchElementException`. If they are valid, print the message 'valid' or else print an Invalid message.

#### ***Input Format***

The first line of the input consists of a string representing the Register number.

The second line of the input consists of a string representing the Mobile number.

### **Output Format**

The output should display any one of the following messages:

If both numbers are valid, print "Valid".

If an exception is raised, print "Invalid with exception message: ", followed by the specific exception message.

Refer to the sample output for the formatting specifications.

### **Sample Test Case**

Input: 19ABC1001  
9949596920

Output: Valid

### **Answer**

# You are using Python

```
import re
```

```
class IllegalArgumentException(Exception):
```

```
    pass
```

```
class NumberFormatException(Exception):
```

```
    pass
```

```
class NoSuchElementException(Exception):
```

```
    pass
```

```
try:
```

```
    reg=input().strip()
```

```
    mob=input().strip()
```

```
    if len(reg)!=9:
```

```
        raise IllegalArgumentException("Register Number should have exactly 9  
characters.")
```

```
    if not reg.isalnum():
```

```
        raise NoSuchElementException("Register Number should only contain  
alphanumeric characters.")
```

```
    if not re.fullmatch(r"\d{2}[A-Za-z]{3}\d{4}",reg):
```

```
        raise IllegalArgumentException("Register Number should have the format: 2
```

```
Numbers,3 Characters,and 4 Numbers.")
if len(mob)!=10:
    raise IllegalArgumentException("Mobile Number should have exactly 10
characters.")
if not mob.isdigit():
    raise NumberFormatException("Mobile Number should only contain digits.")
print("Valid")
except(IllegalArgumentException,NumberFormatException,NoSuchElementException) as e:
    print("Invalid with exception message:"+str(e))
```

**Status :** Correct

**Marks :** 10/10

## 2. Problem Statement

Implement a program that checks whether a set of three input values can form the sides of a valid triangle. The program defines a function `is_valid_triangle` that takes three side lengths as arguments and raises a `ValueError` if any side length is not a positive value. It then checks whether the sum of any two sides is greater than the third side to determine the validity of the triangle.

### **Input Format**

The first line of input consists of an integer A, representing side1.

The second line of input consists of an integer B, representing side2.

The third line of input consists of an integer C, representing side3.

### **Output Format**

The output prints either "It's a valid triangle" if the input side lengths form a valid triangle,

or "It's not a valid triangle" if they do not.

If there is a `ValueError`, it should print "ValueError: <error\_message>".

Refer to the sample output for the formatting specifications.

### **Sample Test Case**

Input: 3

4

5

Output: It's a valid triangle

### **Answer**

# You are using Python

```
def valid(a,b,c):
```

```
    if(a<=0 or b<=0 or c<=0):
```

```
        raise ValueError("Side lengths must be positive")
```

```
    return a+b>c and a+c>b and b+c>a
```

```
try:
```

```
    a=int(input())
```

```
    b=int(input())
```

```
    c=int(input())
```

```
    if(valid(a,b,c)):
```

```
        print("It's a valid triangle")
```

```
    else:
```

```
        print("It's not a valid triangle")
```

```
except ValueError as e:
```

```
    print(f"ValueError: {e}")
```

**Status : Correct**

**Marks : 10/10**

### **3. Problem Statement**

Alice is developing a program called "Name Sorter" that helps users organize and sort names alphabetically.

The program takes names as input from the user, saves them in a file, and then displays the names in sorted order.

File Name: sorted\_names.txt.

### **Input Format**

The input consists of multiple lines, each containing a name represented as a string.

To end the input and proceed with sorting, the user can enter 'q'.

### ***Output Format***

The output displays the names in alphabetical order, each name on a new line.

Refer to the sample output for the formatting specifications.

### ***Sample Test Case***

Input: Alice Smith  
John Doe  
Emma Johnson  
q

Output: Alice Smith  
Emma Johnson  
John Doe

### ***Answer***

```
def fun():
    names=[]
    while(True):
        name=input()
        if name.strip().lower()=='q':
            break
        names.append(name.strip())
    names.sort()
    with open("sorted_names.txt",'w') as file:
        for name in names:
            file.write(name+'\n')
    for name in names:
        print(name)
fun()
```

**Status :** Correct

**Marks :** 10/10

#### 4. Problem Statement

Alex is creating an account and needs to set up a password. The program prompts Alex to enter their name, mobile number, chosen username, and desired password. Password validation criteria include:

Length between 10 and 20 characters. At least one digit. At least one special character from !@#\$%^&\* set. Display "Valid Password" if criteria are met; otherwise, raise an exception with an appropriate error message.

##### ***Input Format***

The first line of the input consists of the name as a string.

The second line of the input consists of the mobile number as a string.

The third line of the input consists of the username as a string.

The fourth line of the input consists of the password as a string.

##### ***Output Format***

If the password is valid (meets all the criteria), it will print "Valid Password"

If the password is weak (fails any one or more criteria), it will print an error message accordingly.

Refer to the sample outputs for the formatting specifications.

##### ***Sample Test Case***

Input: John

9874563210

john

john1#nhøj

Output: Valid Password

##### ***Answer***

```
# You are using Python
```

```
import re
```

```
input().strip()
input().strip()
input().strip()
pwd=input().strip()
```

```
if(not re.search(r"\d",pwd)):
    print("Should contain at least one digit")
elif(not re.search(r"[!@#$%^&*]",pwd)):
    print("It should contain atleast one special character")
elif(len(pwd)<10 or len(pwd)>20):
    print("Should be a minimum of 10 characters and a maximum of 20
characters")
```

```
else:
    print("Valid Password")
```

**Status :** Partially correct

**Marks :** 6.5/10
